4 September 2015

Accentuation/prominence of syllable(s) in a word

In German:

- ▶ Variable placement, contrastive function

um·FAHR·en	vs.	UM·fahr·en
<i>to drive around</i>		<i>to run over</i>

- ▶ Reflected by duration, fundamental frequency (F0), intensity¹
- ▶ Impacts intelligibility of non-native (L2) speech²

¹Dogil and Williams 1999.

²Hirschfeld 1994.

- ▶ Contrastive LS notoriously difficult for French speakers¹
- ▶ CAPT offers huge potential for individualized instruction
- ▶ Classification of LS errors in L2 German unexplored
- ▶ Promising recent work using machine learning for classification of English stress patterns²

Our goal: explore classification-based detection of lexical stress errors by French learners of German

¹Dupoux et al. 1997.

²Kim and Beutnagel 2011; Shahin et al. 2012.

Subset of IFCASL corpus of French-German speech¹

[TODO new screenshot]

Extracted utterances of 12 bisyllabic, initial-stress words

- ▶ 668 tokens from 56 French speakers - manually annotated
- ▶ 477 tokens from 40 German speakers - assumed correct

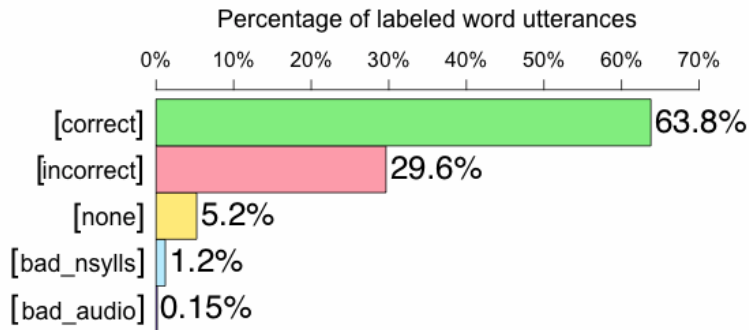

¹Fauth et al. 2014.

- ▶ Each token assigned a class label:
3 stress classes: [correct], [incorrect], [none] 2 error classes: [bad_nsylls], [bad_audio]
- ▶ 15 annotators (12 native), each token labeled by ≥ 2

Overall pairwise inter-annotator agreement

	Mean	Maximum	Median	Minimum
% Agreement	54.92%	83.93%	55.36%	23.21%
Cohen's κ	0.23	0.61	0.26	-0.01

- ▶ Variability not explained by L1 or expertise
- ▶ Single gold-standard label selected for each token

Train & evaluate CART classifiers using WEKA toolkit¹

Training data

- ▶ Manually annotated L2 utterances
- ▶ Automatically annotated L1 utterances (all [correct])

Held-out testing data

- ▶ Feature comparison: 1/10 of L2 utterances (random)
- ▶ Unseen speakers: all utterances from 1 of 56 L2 speakers

Evaluation

- ▶ Compute agreement (% and κ) with gold standard
- ▶ Average across 10 or 56 folds

¹www.cs.waikato.ac.nz/ml/weka

Prosodic feature sets

- ▶ DUR - Duration (relative syllable & nucleus lengths)
- ▶ F0 - Fundamental frequency (mean, max., min., range)
- ▶ INT - Intensity (mean, max.)

Pitch and energy contours calculated using JSnoori software¹

For German stress, duration seemingly best indicator, then F0²

¹`jsnoori.loria.fr`

²Dogil and Williams 1999.

Prosodic feature sets

- ▶ DUR - Duration
- ▶ F0 - Fundamental frequency
- ▶ INT - Intensity

Other features

- ▶ WD - Word uttered (e.g. *Flagge*)
- ▶ LV - Speaker's skill level (A2|B1|B2|C1)
- ▶ AG - Speaker's age/gender (Girl|Boy|Woman|Man)

	% agreement	κ
Best classifier vs. gold standard	71.87%	0.34
Majority baseline vs. gold standard	63.77%	0.00
Human vs. human	54.92%	0.23

- ▶ Results are encouraging in this context
- ▶ Still want better performance for real-world use
